GreenLang Climate OS

v3 Business Plan, Market Expansion Blueprint, Financial Model Summary, and Scaling Roadmap

Planning horizon: FY27–FY31 (2026–2031)

Core recommendation

Expand beyond industrial decarbonization into buildings, power, transport, agrifood, water, waste/circularity, risk/public sector, and climate finance — but still build GreenLang as one sequenced platform with one data/ledger/policy/evidence substrate, not as 30 unrelated products launched at once.

Prepared for	GreenLang founding team
Prepared on	13 Apr 2026
Recommended company shape	Delaware C-Corp parent + India engineering subsidiary + later foundation
Operating stance	Open-core, VC-backable, standards-friendly climate operating system

Executive summary

GreenLang should broaden from industrial decarbonization into a full Climate OS for the physical economy. The expanded scope materially increases the market, strengthens the data moat, and improves long-term platform value — but only if the company preserves a phased operating plan.

- Broadened 2031 GreenLang-addressable TAM: about $35.8B across compliance, supply chain/product carbon, operational optimization, power, transport, agrifood/water/nature, risk/public sector, climate finance, and carbon markets.
- Initial 2031 SAM: about $6.7B focused on India, EU+UK, North America, Singapore+ASEAN, the Middle East, and export-led global supply corridors.
- Base-case FY31 target: $95M end ARR, $77M recognized revenue, 520 paying logos, 165 employees, 350k developers, and a platform spanning 36 modules/products.
- Recommended structure: Delaware C-Corp parent, India Pvt Ltd product/engineering subsidiary, UK or Netherlands entity for EMEA, Singapore entity for APAC, and an independent foundation later for open-source governance.
- Recommended funding path: $7M Seed, $18M Series A, $40M Series B, plus targeted non-dilutive capital from EIC, DOE, Singapore, and consortium projects.

Blunt view

The expanded GreenLang thesis is strong. The danger is not the vision — it is execution sprawl. The company wins by becoming the system of record, system of action, and system of trust for climate workflows. That means a unified substrate first, then sector clouds, then transaction and finance rails.

Why broaden beyond industrial decarbonization

Industrial decarbonization remains the strongest initial wedge, but it is not sufficient if GreenLang wants to become a true climate operating system. A broader scope is justified because climate spend, climate risk, and climate regulation are converging across the entire physical economy.

- Buildings and construction are large enough to matter on their own and are close cousins to industrial energy optimization.
- Power, PPAs, flexibility, and microgrids turn GreenLang from a reporting tool into an execution system for electrification and procurement.
- Transport and freight extend the platform into one of the most common Scope 3 and operating-cost domains.
- Agrifood, water, methane, and nature are critical if GreenLang wants relevance in food, consumer goods, infrastructure, and sovereign/public-sector use cases.
- Climate finance, portfolio analytics, adaptation, and public-sector planning expand buyer categories beyond sustainability teams into CFOs, treasuries, investors, utilities, insurers, and cities.

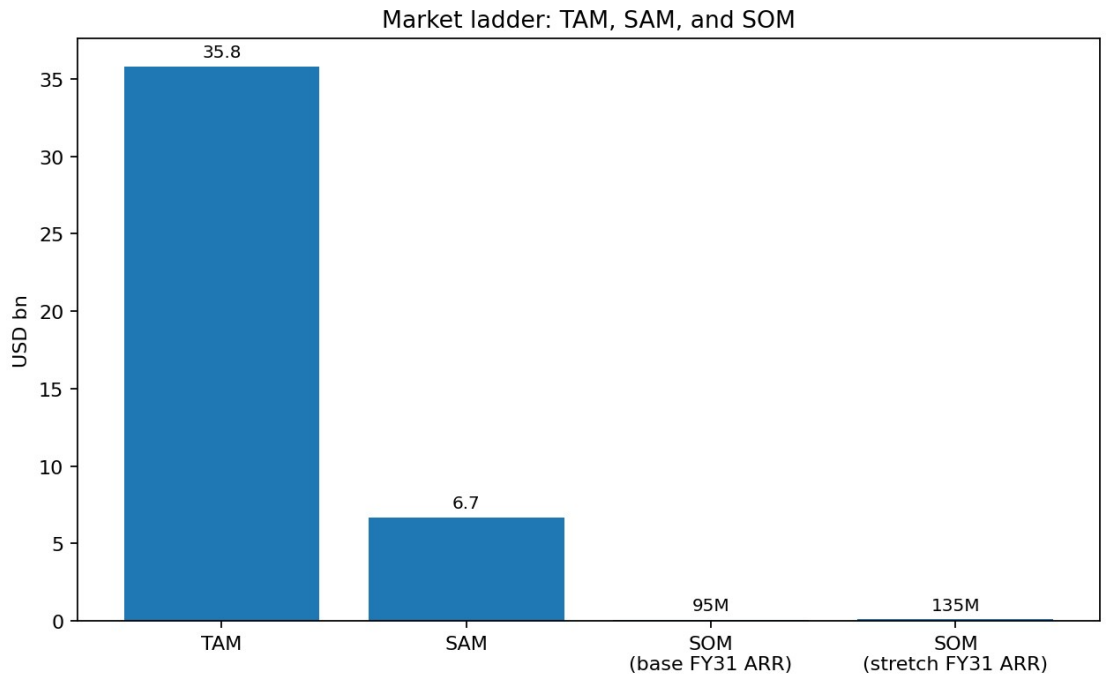

Figure 1. Market ladder for the expanded GreenLang scope.

Expanded sector map for Climate OS

To become a true Climate OS, GreenLang should serve nine sector and buyer domains on top of one common intelligence layer.

Sector cloud	Key GreenLang products	Primary buyers
Industrial / manufacturing	PlantOS, Scope Engine, SupplierOS, PCF/DPP, Proof Hub	Plants, OEMs, exporters, industrial groups
Buildings / campuses / data centers	BuildingOS, DataCenter CarbonOps, PowerOS	Real estate, hotels, campuses, colocation, hyperscale supply chain
Power / utilities / energy buyers	PowerOS, PPA tools, FlexOS, Microgrid Planner	Utilities, large buyers, industrial parks, campuses
Transport / logistics	FleetOS, Freight Carbon API, supplier/product carbon	Fleets, shippers, forwarders, OEM logistics teams
Agrifood / land / water / methane	AgriLandOS, WaterOS, Methane & Nitrogen Monitor, Nature Hub	Food brands, agribusiness, co-ops, utilities
Waste / circularity / materials	Circularity Hub, DPP, product traceability	Packaging, waste, materials, consumer goods
Risk / adaptation / insurance / public sector	RiskOS, Adaptation Planner, CityOS	Cities, infrastructure owners, utilities, insurers
Climate finance / portfolio	FinanceOS, Transition Finance Studio	Banks, PE, asset managers, lenders, insurers
Carbon markets / MRV / removals	MRV Studio, Carbon Markets Hub, CDR	Project developers, buyers, verifiers,

	Portfolio Manager	traders

TAM, SAM, and SOM

The broadened market is large enough to justify the platform thesis, but still bounded enough to allow a disciplined entry strategy.

Sizing logic

- TAM is defined as the 2031 annual GreenLang-addressable revenue pool for software, data, workflow, and transaction take-rates that fit the GreenLang product architecture.
- SAM narrows that to the first commercial geography set and buyer segments GreenLang can credibly reach in five years.
- SOM is defined as GreenLang's own FY31 revenue capture under a base-case plan.

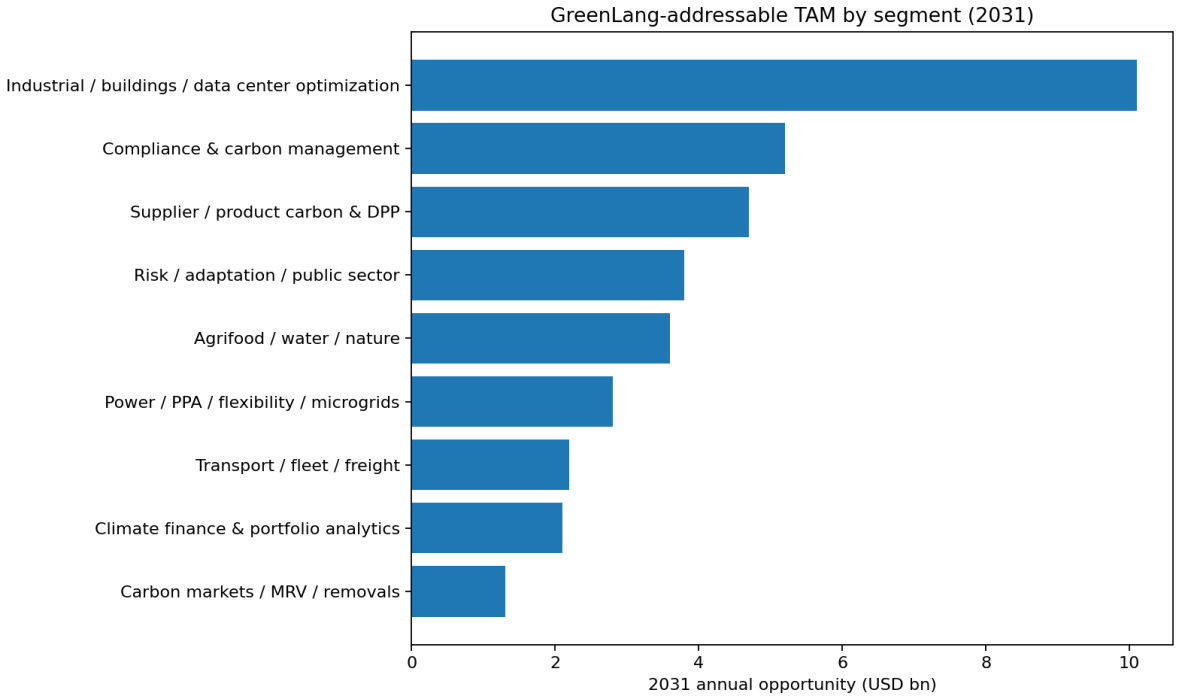

Figure 2. 2031 TAM by segment (GreenLang-addressable).

Segment	TAM 2031 ($bn)	Share
Compliance & carbon management	5.2	14.5%
Supplier / product carbon & DPP	4.7	13.1%
Industrial / buildings / data center optimization	10.1	28.2%
Power / PPA / flexibility / microgrids	2.8	7.8%
Transport / fleet / freight	2.2	6.1%

Agrifood / water / nature	3.6	10.1%
Risk / adaptation / public sector	3.8	10.6%
Climate finance & portfolio analytics	2.1	5.9%
Carbon markets / MRV / removals	1.3	3.6%

Initial serviceable market

Geo	Focus	SAM 2031 ($bn)
India	industrial exporters, energy-intensive sectors, supplier chains, public-sector pilots	1.6
EU + UK	CBAM, CSRD/ESRS, DPP, heavy industry, power buyers, real estate	2.3
North America	selected reporting, building/data center, finance, carbon markets	1.1
Singapore + ASEAN	regional HQs, carbon tax, industrial parks, shipping/logistics	0.6
Middle East	industrial clusters, utilities, adaptation/water, project finance	0.5
Other initial export-led corridors	ocean freight, global suppliers, climate finance	0.6

Sizing conclusion

Base-case FY31 SOM is about $95M ARR, or roughly 1.4% of the initial SAM. Stretch case is about $135M ARR, or 2.0% of SAM. That is aggressive enough to be venture-scale and still realistic enough to plan against.

What GreenLang should actually be

GreenLang should be a climate intelligence substrate with sector clouds on top, not a bundle of disconnected applications. The right architecture has four layers.

Layer	Core modules	Why it matters
Layer 1 – Data foundation	Factors, Connectors, Entity Graph, IoT schemas, external datasets	One normalized climate data model across facilities, suppliers, products, assets, markets, and policies
Layer 2 – System of record	Climate Ledger, Evidence Vault, Proof Hub	Auditable records for activity data, emissions, product footprints, and evidence

Layer 3 – Intelligence layer	Policy Graph, Agent Runtime, Eval, scenario engines, benchmarks	Regulation-aware AI workflows and decision support
Layer 4 – Sector clouds	Comply, SupplierOS, PlantOS, BuildingOS, FinanceOS, RiskOS, CityOS, etc.	Commercial applications built on the same substrate

What this means in practice

- Every sector cloud should read and write to the same Climate Ledger.
- Every high-stakes climate claim should carry evidence, provenance, and methodology metadata.
- Every AI workflow should be policy-aware, human-reviewable, and benchmarked.
- Every connector, factor mapping, and product-footprint object should be reusable across multiple products.

GreenLang ecosystem – all products in scope

The expanded product bank can support a very large company, but it should not be built as 36 independent startups. Products should be treated as modules that compound on top of shared infrastructure.

Core Platform

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang Factors	FY27	Developers, consultants, platforms	API + enterprise support
GreenLang Connect	FY27	ERP/procurement/utility/IoT connectors	Subscription + implementation
GreenLang Entity Graph	FY27	Multi-entity enterprises	Included in platform
GreenLang Climate Ledger	FY27	Enterprises, auditors	Platform subscription
GreenLang Evidence Vault	FY27	Enterprises, verifiers, auditors	Platform subscription
GreenLang Policy Graph	FY27	Compliance teams, advisers	Subscription
GreenLang Agent Runtime + Eval	FY27	Internal teams, partners	Platform subscription
GreenLang SDK/API/CLI	FY27	Developers & partners	Usage + hosted services

Compliance Cloud

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang Comply	FY27	Large enterprises	ACV subscription
GreenLang CBAM	FY27	EU importers/exporters	Module subscription
GreenLang Scope Engine	FY27	Corporate sustainability & finance	Module subscription

Supply Chain Cloud

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang SupplierOS	FY28	Procurement & sustainability teams	Per-supplier + platform
GreenLang PCF Studio	FY28	Manufacturers/OEMs	Per-SKU + platform
GreenLang DPP Hub	FY28	OEMs, importers	Per-DPP + platform
GreenLang Proof Hub	FY29	Auditors, verifiers, enterprises	Seat + platform

Operations Cloud

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang PlantOS	FY28	Manufacturing plants	Outcome + subscription
GreenLang BuildingOS	FY28	Real estate, campuses, hotels	Outcome + subscription
GreenLang DataCenter CarbonOps	FY29	Data center operators	Outcome + subscription
GreenLang PowerOS	FY29	Large buyers, utilities	Subscription
GreenLang FlexOS	FY30	C&I sites, aggregators	Revenue share + subscription
GreenLang Microgrid Planner	FY30	Industrial parks, campuses	Project licenses

Mobility Cloud

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang FleetOS	FY29	Fleets, logistics operators	Per-vehicle subscription
GreenLang Freight Carbon API	FY30	Shippers, forwarders	Usage/API

Land/Water/Nature

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang AgriLandOS	FY30	Food brands, agribusiness, co-ops	Per-farm/co-op subscription
GreenLang WaterOS	FY30	Utilities, industry, cities	Subscription
GreenLang Methane & Nitrogen Monitor	FY30	Agrifood, O&G, waste	Subscription

GreenLang Nature/TNFD Hub	FY31	Corporates, asset owners	Module subscription

Risk & Public Sector

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang RiskOS	FY29	Enterprises, financiers, insurers	API + enterprise
GreenLang Adaptation Planner	FY30	Infra owners, utilities, cities	Subscription + services
GreenLang CityOS	FY31	Cities, states, utilities	Multi-year licenses

Finance & Markets

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang FinanceOS	FY29	Banks, investors, PE, insurers	Enterprise subscription
GreenLang Transition Finance Studio	FY30	Project finance, green bonds	Deal + subscription
GreenLang MRV Studio	FY29	Project developers, verifiers	Platform + per-project
GreenLang Carbon Markets Hub	FY30	Corporates, traders, marketplaces	Take-rate + analytics
GreenLang CDR Portfolio Manager	FY31	Large buyers & intermediaries	Subscription + take-rate

Circularity

Product	Launch FY	Primary Buyer	Revenue Model
GreenLang Circularity Hub	FY31	Packaging/material/product firms	Platform subscription

Five-year product rollout plan

The operating discipline is simple: start with the substrate and the compliance-to-supplier wedge, then expand into operations, then finance/risk/public-sector and multi-sided network products.

FY27 – foundation and first revenue

- Ship Factors, Connect, Entity Graph, Climate Ledger, Evidence Vault, Policy Graph, SDK/API/CLI, Agent Runtime + Eval.
- Launch first commercial wedge: Comply, CBAM, Scope Engine.
- Land first 5–8 design partners in India-linked exporters, EU-facing manufacturers, and carbon-intensive supply chains.
- Target first repeatable data model and first platform ARR.

FY28 – supply chain and operations expansion

- Add SupplierOS, PCF Studio, DPP Hub, PlantOS, and BuildingOS.
- Move from point compliance into supplier/product and facility-level workflows.
- Open Europe GTM hub and begin cross-border supplier network expansion.

FY29 – finance, risk, and deeper operations

- Add Proof Hub, DataCenter CarbonOps, PowerOS, FleetOS, RiskOS, FinanceOS, and MRV Studio.
- Introduce product lines that increase ACV and add finance/risk buyers.
- Start partner network with auditors, consultants, verifiers, ERP integrators, and lenders.

FY30 – network and project-execution layer

- Add FlexOS, Microgrid Planner, Freight Carbon API, AgriLandOS, WaterOS, Methane & Nitrogen Monitor, Adaptation Planner, Transition Finance Studio, and Carbon Markets Hub.
- Begin monetizing transactions and capital-planning workflows in addition to pure SaaS.

FY31 – public-sector and circularity expansion

- Add Nature/TNFD Hub, CityOS, CDR Portfolio Manager, and Circularity Hub.
- By this point GreenLang should look like a true Climate OS, with one substrate serving enterprise, finance, project, and public-sector users.

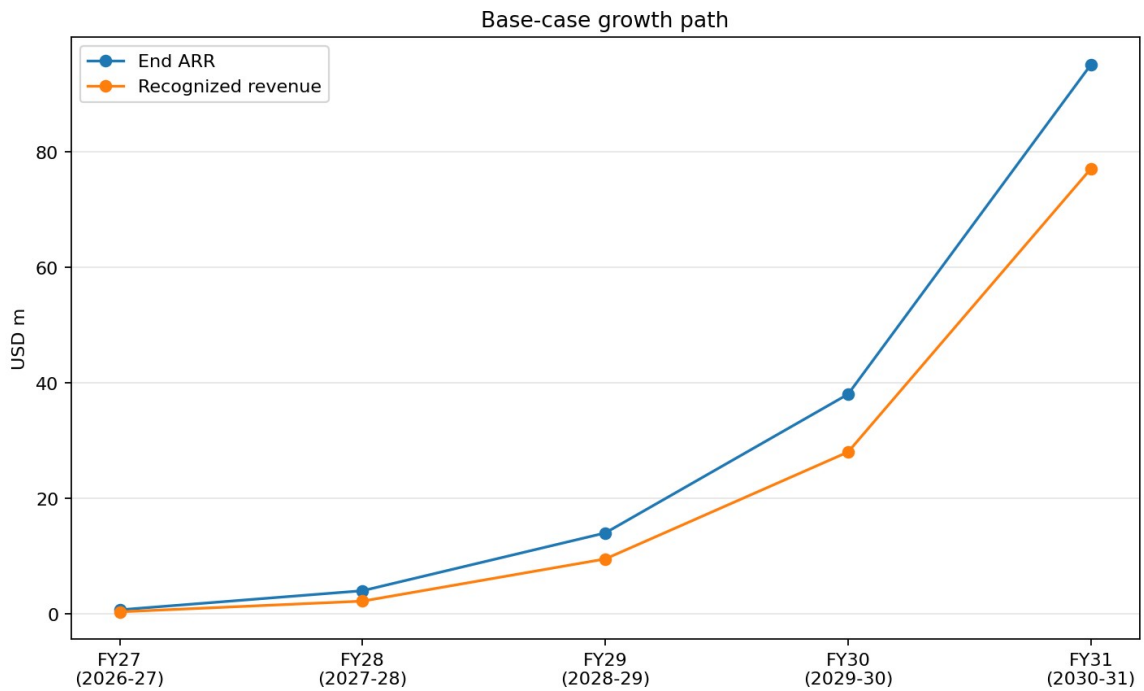

Figure 3. Base-case growth path: end ARR and recognized revenue.

Business model

GreenLang should monetize with a layered model, not a single price point. The right mix is subscriptions first, then usage/data, then performance and transaction take-rates.

Revenue stream	Examples	Role in the model
Enterprise subscriptions	Comply, SupplierOS, PCF/DPP, RiskOS,	Anchor ARR and drive renewals

	FinanceOS, CityOS	
Usage / API / data	Factors, Connect, SDK/API, Freight API, risk data	Scales with developer and partner ecosystem
Performance share	PlantOS, BuildingOS, FlexOS	Links GreenLang to customer ROI and savings
Transaction take-rate	Carbon markets, CDR, transition finance, PPA / marketplace style flows	Creates platform upside once workflows mature
Professional services	Implementations, data onboarding, custom templates, verification support	Useful early, should decline as share of revenue over time
Non-dilutive / consortium income	R&D grants, pilots, consortium projects	Helpful but should not define the company

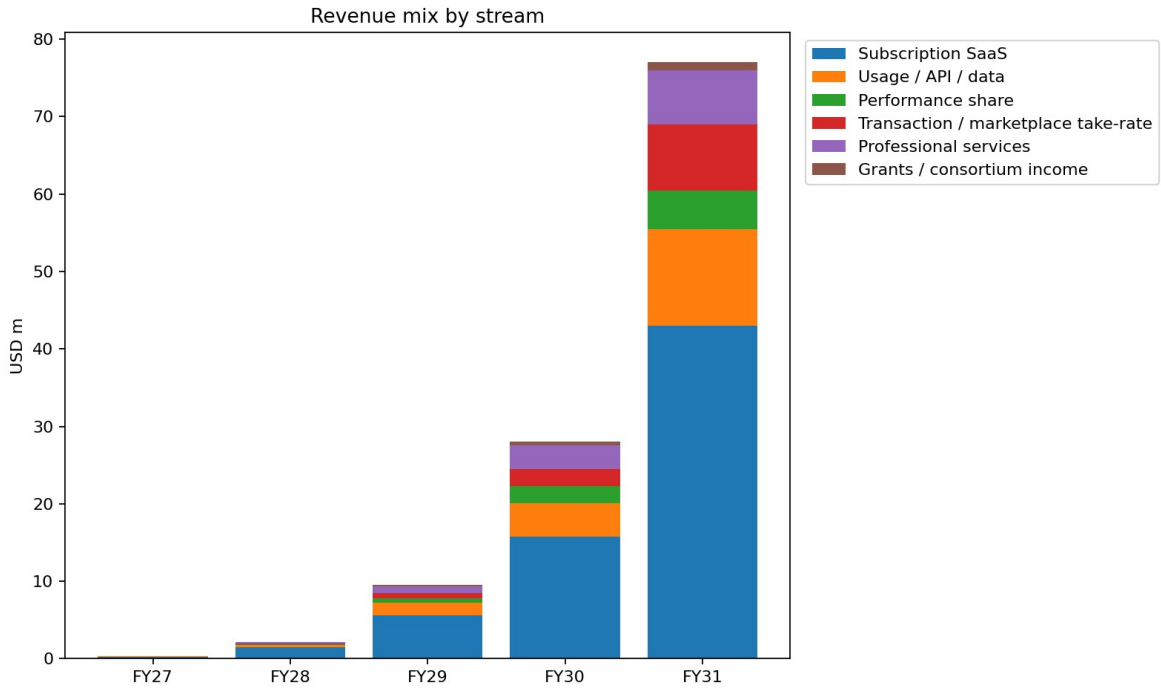

Figure 4. Modeled revenue mix by stream.

Go-to-market

GreenLang should not start by selling to everyone. The go-to-market motion should compound through one beachhead.

Motion	What it means	Why it matters
Beachhead	India-linked manufacturers and exporters selling into EU/global OEM supply chains	High regulatory pull, clear supplier/product-carbon pain, easier multi-product expansion
Expansion vector 1	SupplierOS + PCF/DPP into tiered supply	Converts compliance into network data

	chains	moat
Expansion vector 2	PlantOS / BuildingOS / PowerOS into operational savings	Adds CFO-grade ROI and embeds GreenLang into operations
Expansion vector 3	RiskOS / FinanceOS / public-sector products	Expands buyer map beyond sustainability teams
Channel partners	Consultants, auditors, ERP integrators, climate-advisory firms, utilities, financiers	Reduces acquisition cost and increases trust
Open-source motion	Factors + SDK + community assets	Top-of-funnel and talent magnet; supports standard-setting

Incorporation, governance, and company structure

Recommended answer: use a VC-backable operating company now, and add ecosystem governance later.

Structure	Strengths	Weaknesses	Recommendation
Delaware C-Corp	Fastest fundraising, simplest governance, familiar for investors	Mission lock is weaker unless added by charter / governance	Best default recommendation
Delaware PBC	Better mission signaling and public-benefit framing	Slightly more complexity; still can work with many VCs	Good only if lead investors support it
Nonprofit-controlled hybrid	Strong mission symbolism	Complex governance, slower decisions, harder fit at seed stage	Not recommended at inception
Foundation + operating company later	Keeps business agile while protecting community assets later	Requires good governance design when launched	Recommended in years 3–4

Recommended legal stack

- Parent: Delaware C-Corp.
- Subsidiary 1: India Pvt Ltd for product, engineering, data, climate science, and implementation.
- Subsidiary 2: UK Ltd or Netherlands BV for EMEA sales and contracts by FY28.
- Subsidiary 3: Singapore Pte Ltd for APAC by FY29.
- Optional regional entity: GCC operating entity by FY30 once project-finance and utility pipelines justify it.
- Independent GreenLang Foundation: FY29–FY30, stewarding schemas, factor governance, open-source repositories, and community standards.

Where GreenLang should be developed and how it should scale geographically

The company should be built in India first, sold into Europe early, and then expanded into Singapore and the Middle East.

Year	Office / hub plan	What it unlocks
FY27	Bengaluru HQ; remote/regulatory presence in Europe	Build platform, land design partners, keep burn disciplined
FY28	Bengaluru + London/Amsterdam GTM hub	Support CBAM/EMEA sales and supplier network growth
FY29	Add Singapore commercial hub	Broaden into ASEAN, regional HQs, and project partnerships
FY30	Add GCC foothold; selective North America BD	Support utilities, water/adaptation, finance and infrastructure buyers
FY31	Multi-region operating company	India product core plus Europe, Singapore, GCC, and selected North America presence

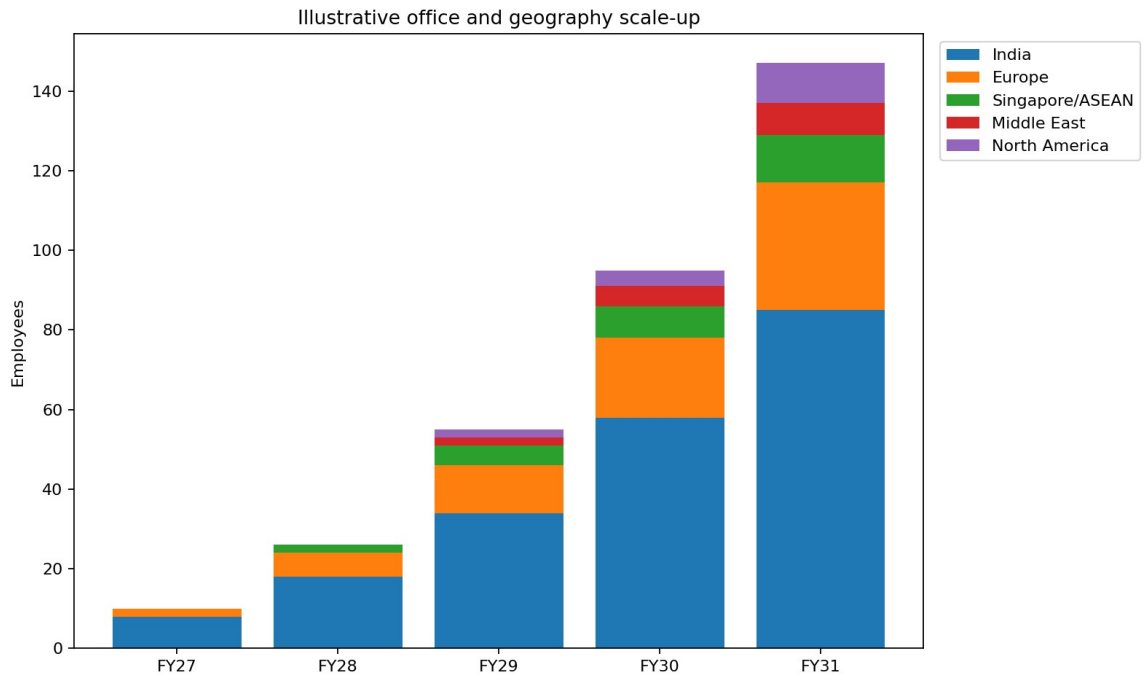

Figure 5. Illustrative geographic headcount scale-up.

Five-year financial plan

The model below is intentionally ambitious but not fantasy-driven. It assumes GreenLang becomes a real platform company, not just a compliance tool.

Metric	FY27	FY28	FY29	FY30	FY31
End ARR ($m)	0.7	4.0	14.0	38.0	95.0
End MRR ($m)	0.1	0.3	1.2	3.2	7.9
Recognized revenue	0.3	2.2	9.5	28.0	77.0

($m)					
Paying logos	8	30	85	220	520
Developers	4,000	20,000	65,000	160,000	350,000
Contributors	80	220	600	1,400	3,000
Headcount (EOY)	12	30	60	110	165
Fundraise ($m)	7.0	18.0	0.0	40.0	0.0
Grant cash inflow ($m)	0.1	0.4	0.8	1.0	1.0

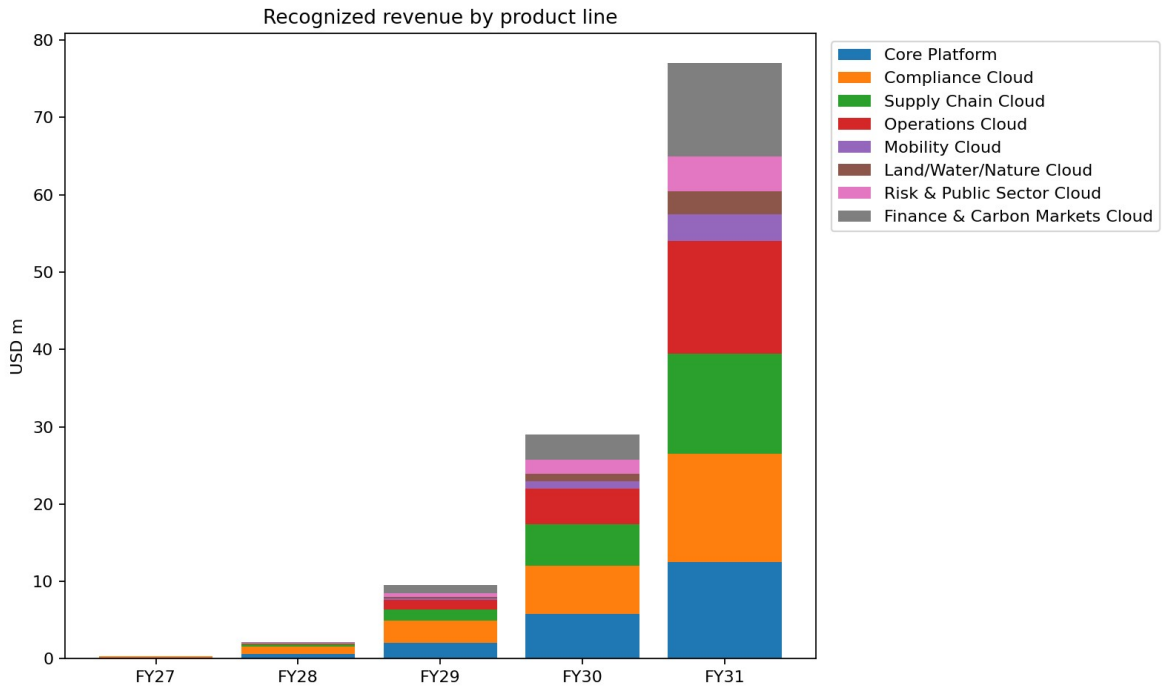

Figure 6. Recognized revenue by product line.

Three-statement interpretation

- The model assumes heavy investment through FY30, with profitability turning positive in FY31.
- Gross margin rises from 38% to 73% as recurring software/API and network products become dominant.
- The model remains venture-backed through a Seed, Series A, and Series B, but non-dilutive funding is still worth pursuing for pilots and deep-tech modules.

Grants, fundraising, and capital strategy

GreenLang should be built as a venture-scale company, not as a grant-first organization. But selective non-dilutive funding can still be useful.

Capital source	Timing	Illustrative size	Use of funds

Seed	FY27	$7M	Platform build, first wedges, design partners, initial GTM
Series A	FY28	$18M	Supplier/product carbon, operations cloud expansion, Europe build-out
Series B	FY30	$40M	Network products, finance/risk/public-sector expansion, multi-region scale
Non-dilutive	FY27-FY31	$0.15M–$1.0M per year	Pilots, R&D, consortium work, market-entry support

Good grant behavior

- Use grants to de-risk modules that have public-good externalities: open datasets, standards work, public-sector pilots, and frontier MRV or adaptation tooling.
- Do not bend the product roadmap around grants.
- Treat grants as acceleration capital, not as the company's identity.

Scalability potential

GreenLang can scale unusually well if it earns the right kind of compounding advantages.

Scalability lever	Why it matters
Data network effects	More connectors, factors, product records, supplier evidence, and verified outputs make the platform more useful for everyone
Workflow lock-in	Once Climate Ledger, product footprints, evidence, and policy mappings are embedded, replacement cost becomes high
Multi-product expansion	One customer can add compliance, supplier/product, plant, building, risk, finance, and public-sector modules over time
Developer distribution	Open-core assets can create bottom-up adoption and partner integrations
Regulatory compounding	As rules multiply, the value of a shared policy graph and audit substrate increases
Network / transaction upside	Markets, finance, and capital-planning workflows can create platform take-rates on top of SaaS

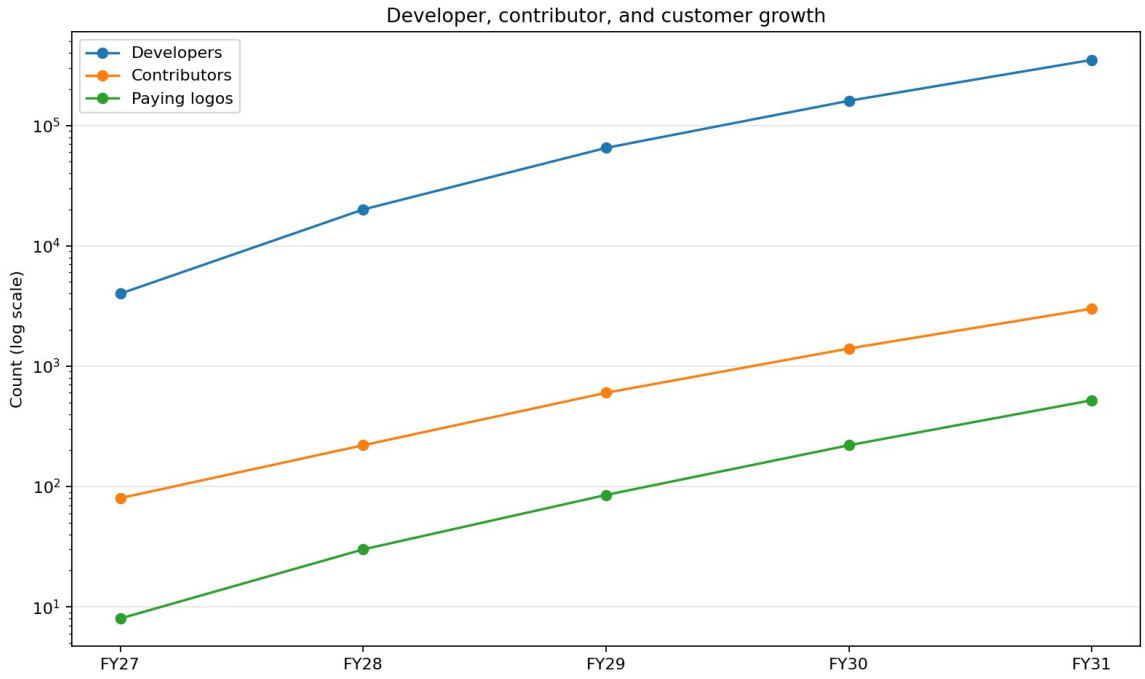

Figure 7. Developer, contributor, and paying-customer growth.

Key risks and mitigations

Risk	What could go wrong	Mitigation
Execution sprawl	Trying to run too many product lines in parallel	Keep one platform substrate, one wedge, one sequencing plan; use kill criteria
Data quality / methodology risk	Wrong mappings or unverifiable claims damage trust	Evidence Vault, auditability, methodology governance, expert review
Regulatory volatility	Rules can change or simplify	Policy Graph with fast update cadence; avoid a compliance-only identity
Sales-cycle drag	Enterprise climate software can sell slowly	Anchor on urgent regulatory pain and hard-ROI operations use cases
Open-source confusion	Community may confuse free assets with full platform	Clear open-core boundaries and commercial packaging
Capital intensity	Climate + enterprise + open-source can burn cash fast	Strict phase gates, partner-led distribution, disciplined hiring

90-day, 12-month, and 24-month plan

The business only becomes real through sequencing. This is the shortest useful operating plan.

First 90 days

- Finalize legal structure and open-source governance stance.
- Recruit platform/data lead, product lead for compliance/supplier wedge, and climate methodology lead.

- Define v1 data model: entity, facility, supplier, product, factor, evidence, policy object.
- Secure 5–8 design partners and one reference architecture partner.
- Launch GreenLang Factors and SDK in narrow initial form.

First 12 months

- Ship Comply, CBAM, Scope Engine, Climate Ledger, and initial Connectors.
- Convert at least 2–3 pilots into paid ARR.
- Publish clear OSS/commercial boundaries and partner roadmap.
- Validate one repeatable GTM motion with India-linked exporters and supply-chain-heavy enterprises.

Months 12–24

- Launch SupplierOS, PCF Studio, DPP Hub, PlantOS, and BuildingOS.
- Raise Series A on evidence of repeatability and multi-product expansion.
- Open Europe commercial presence and formalize system-integrator / verifier channels.

Appendix A – selected source anchors used in this plan

The following external anchors are current as of 13 Apr 2026 and were used to refresh the market, policy, structure, and grant assumptions. Many TAM and financial figures in the model are still internally modeled planning assumptions rather than directly sourced market-size claims.
